

The AI master students reported that AI representations in form of screens, industrial robots, and networks are the most appropriated according to the JKU Robopsychology Lab. My visualization points out that AI is a digital construct which makes decisions based on data which is the key message for an amateur to take away. The color green for the network with black background was chosen because IT related stuff is often represented in this color setting whereas the hardware is not of priority here and therefore it is visualized in white/transparently.
